

Signature Properties -- pdf.js test corpus

=====

This PDF is part of the manual-test corpus for the Signature Properties UI. The text below describes what the toolbar button and the doorhanger should look like when this file is opened in a Firefox build with `security.pdf_signature_verification.enable_test_trust_anchors` set to true.

Expected verification state: INVALID -- Signed_invalid

After signing, one byte inside the document was flipped, so the PKCS#7 messageDigest no longer matches the actual ByteRange data. NSS returns SEC_ERROR_PKCS7_BAD_SIGNATURE -- the signature is no longer valid evidence that the document is intact.

Toolbar icon: RED circle with white cross.

Banner: RED. "Document has an invalid signature".

Status row: red cross, "Status: Signature invalid".

Certificate row: green check (cert was fine, only the signature broke), "Certificate: Trusted (pdf-sign-ca)".
